

FUNCTIONAL AND OPERATIONAL DOCUMENTATION

Project Performance Improvement Toolkit

Operating manual for users and administrators

Technical source: oli_v6_deploy.py

Updated: May 11, 2026

1. Functional Description

The application helps review project and evaluation documents, query loaded documents, classify recommendations, and analyze institutional responses. The active interface has six tabs.

2. User Requirements

- Use a modern browser with a stable connection.
- Have institutional authorization to upload documents into the application.
- Upload DOCX files with Word heading styles when using appraisal, attributes, or sustainability flows.
- Treat AI results as supporting evidence, not as a substitute for human technical review.

3. Main Navigation

Tab	When to Use It	Main Output
Valoracion Preliminar de Calidad de Proyectos	Comprehensive review of a project design document.	ZIP with XLSX questions, subsection/section analysis, template, and TXT summary.
Diagnostico de Atributos Especificos	Focused evaluation of participation in evaluation, gender, or just transition.	ZIP with XLSX by selected rubric.
Diagnostico de Sostenibilidad del Proyecto	Sustainability review of a PRODOC or similar document.	ZIP with XLSX and score charts.
Preguntale a tus Documentos	Conversational query over one or more DOCX/TXT files.	On-screen answer with session memory.
Clasificacion de Recomendaciones	Classify Spanish-language recommendations and analyze subsets.	Treemaps, temporal evolution, deep-analysis XLSX, and executive-summary XLSX.
Recommendation Classification	Same classification flow in English.	English outputs and downloads.

4. Tab 1: Preliminary Appraisal

1. Download or review Appraisal Checklist_2025 es-419.xlsx from the tab if needed.
2. Upload a DOCX file with Word headings.

3. Click Extract Document and review the extracted structure.
4. Select sections and question filters if applicable.
5. Click Analyze document.
6. Review metrics, result table, reasoning, evidence, and critical evaluation.
7. Download appraisal_checklist_results.zip.

Interpretation: answers are Yes, No, Partial, or Not Found. For questions with a specific subject, the app applies the A-E framework: sub-objective/output, indicator, activity, budget, and quantifiable target. The A-E total can automatically adjust the verdict.

Methodological exception: when the question corresponds to a configured transversal matter (gender, non-discrimination, disability, social dialogue and tripartism, or environmental sustainability), the app applies the reduced A/B rule. A means presence of the matter in an objective, output, or activity; B means associated budget or resources. The grade is Yes if A and B are present, Partial if only A or only B is present, and No if neither appears.

5. Tab 2: Specific Attributes Diagnosis

1. Upload a DOCX file and extract its structure.
2. Select the document sections to evaluate.
3. Choose one or more active rubrics: participation during evaluation, gender integration, or modern just transition.
4. Select criteria within each rubric.
5. Click Process and Evaluate.
6. Review Criterio, Dimension, Score, Analisis, Evidencia, Error, and Rubrica columns.
7. Download resultados_rubricas.zip.

6. Tab 3: Sustainability Diagnosis

1. Download the sustainability rubric if criteria need review.
2. Upload a DOCX file, extract structure, and select sections.
3. Select dimensions and criteria.
4. Click Process and Evaluate.
5. Review results by Dimension, Criterio, Indicador, Score, Analisis, and Evidencia.
6. Use average-by-dimension and score-by-criterion charts to prioritize improvements.
7. Download resultados_evaluacion_prodoc.zip.

7. Tab 4: Ask Your Documents

1. Upload one or more DOCX or TXT files.
2. Confirm they appear as active documents.
3. Ask specific questions; request short citations and metadata when traceability is needed.

4. For small documents, the app uses full context; for large documents, it automatically uses RAG.
5. Keep the session open if chat memory must be preserved.

Answers should be based on the loaded files. If information is not explicit, users should treat any inference as preliminary support and verify it in the document.

8. Tabs 5 and 6: Recommendation Classification

1. Choose default files or upload an XLSX with the Recommendation description column.
2. Apply pre-filters by location, time, theme, technical unit, source, progress, or other available fields.
3. Review record count and unique recommendation count before starting.
4. Decide whether to enable LLM Verification: more accurate, slower, and more costly.
5. Click Start Classification.
6. Explore treemaps by dimension/subdimension and temporal evolution by categories.
7. Use Advanced AI Tools for deep analysis or executive summary on the filtered subset.
8. Download analisis_profundo.xlsx, resumen_ejecutivo.xlsx, deep_analysis.xlsx, or executive_summary.xlsx depending on tab language.

9. Operational Good Practices

- Start with small sections or samples when evaluating a new document.
- Verify textual evidence before using results in formal reports.
- Save downloads with project name, date, and tab used.
- Do not upload documents that are not authorized for processing by external AI services.
- Clear results or reload the app when changing analysis cases.

10. Common Issues

Symptom	Likely Cause	Action
Sections are not detected	The DOCX does not use Word Heading styles.	Correct headings in Word and extract again.
OPENAI API key not found	OPENAI_API_KEY is not available.	Configure the environment variable and restart the app.
Classification does not start	Recommendations_World.xlsx or Frame_Recommendations_English.xlsx is missing.	Restore files or upload a valid XLSX.
Results show Error	Invalid JSON response, rate limit, or API failure.	Retry with fewer criteria/sections or review API quota.
Download does not contain expected results	Previous results persisted in session.	Use Clear results and repeat the flow.
