

ADDITIONAL CLOSING INFORMATION

Project Performance Improvement Toolkit

Contact, maintenance, and future recommendations

Technical source: `oli_v6_deploy.py`

Updated: May 11, 2026

1. Operational Handoff

Daily operation should sit with the ILO team. The original developer should remain last-resort support for technical questions that cannot be resolved through this documentation, code review, and local testing.

Role	Responsibility
ILO owning team	Manage access, data, execution, results, and methodological decisions.
ILO technical administrator	Manage deployment, environment variables, data files, and backups.
Analyst users	Run flows, review evidence, download results, and apply technical judgment.
Original developer	Exceptional support for architecture, complex debugging, or changes beyond ordinary maintenance.

2. Last-Resort Contact

- Legacy channel from previous documentation: ageidv@gmail.com.
- Recommended use: only after reproducing the issue locally, reviewing logs/app messages, and isolating the affected tab or function.
- Include when contacting: date, tab, non-sensitive input file or sample, reproduction steps, error message, and screenshot if internal policy permits.

3. Maintenance Routine

Frequency	Activity
Weekly during active operation	Confirm the app opens, <code>OPENAI_API_KEY</code> works, and a test document processes in Tab 4.
Monthly	Test a sample in Tabs 1, 2, 3, 5, and 6; verify downloads open.
Before each data update	Back up Excel, CSV, .pt, and relevant cache files.
After each code update	Run manual tests by tab and <code>test_two_part_parsing.py</code> if question logic changed.
Every 6-12 months	Review OpenAI models, costs, limits, dependencies, and Streamlit compatibility.

4. Recommendations for Future Updates

- Gradually split the monolith into modules: data loading, document extraction, AI clients, evaluation, and UI.
- Remove obsolete commented blocks after confirming they are unnecessary.
- Consolidate the duplicate `load_extended_data` and `load_embeddings` initialization.
- Add unit tests for `parse_two_part_question`, `_apply_critique_gate_and_render`, classification, and XLSX export.
- Add unit tests for `detect_transversal_matter` and `_apply_transversal_gate_and_render` if the A/B rule becomes critical for institutional reports.
- Create a small set of non-sensitive test documents for reproducible validation.
- Document every Excel schema change with date and responsible ILO owner.
- If core and recommendations variants are retained, synchronize changes from `oli_v6_deploy.py` and test each variant separately.

5. AI and Cost Recommendations

- Keep gpt-5-mini as the main model while results remain consistent with human validation.
- Use LLM Verification in classification only for subsets where additional precision justifies cost and time.
- Use pre-filters and row limits before deep recommendation analysis.
- Preserve `embeddings_cache.pkl` and `analysis_cache.pkl` when processing recurring batches; delete them only if corruption or substantive data changes are suspected.
- Review whether the FAISS recommendation index loaded by `load_embeddings` is still needed in the main app, because the active recommendation-search interface is commented and the classification tabs do not use it.
- Internally record cost estimates by flow with `generate_cost_report.py` if frequent use becomes institutionalized.

6. Change Acceptance Criteria

- The app starts without errors with `streamlit run oli_v6_deploy.py`.
- Tab 1 processes a test DOCX, generates a table, and downloads a ZIP.
- Tab 1 recognizes at least one transversal matter and shows the A/B transversal-criteria audit line in reasoning.
- Tab 2 evaluates at least one selected criterion and downloads a ZIP.
- Tab 3 generates results and charts for a sample.
- Tab 4 answers about a small TXT and a large DOCX.
- Tabs 5 and 6 classify a limited sample and show treemaps.
- No placeholders, real credentials, or unnecessary personal paths appear in handoff documentation.

7. Minimum Handoff Package

- Main code: `oli_v6_deploy.py`.
- Dependencies: `requirements.txt`.
- Updated documentation: the six English DOCX files in `documentation/en`.
- Active data and rubric files listed in the database documentation.
- Internal deployment instructions for the hosting option selected by ILO.
- ILO record of owners for access, data, and deployment.
